Exemple de commande: RFP-8x150/2|

## CARACTERISTIQUES

1. RAPIDITE D'EXECUTION DU LOGEMENT;
2. RAPIDITE DE MONTAGE ET DEMONTAGE;
3. UNIFORMITE DE TEMPERATURE SUR LES PIECES REFROIDIES;
4. ETANCHEITE FIABLE SOUS HOUTE PRESSION (~ 100 Bar).

## NOTE:

1. In the case where it is necessary to position some cooling elements in depth (as in the diagram above) and it is desired to execute the retaining groove using the appropriate tool, you will have to machine the undercut $\varnothing$ T1 with the measures indicated in table.
2. The angle $\beta$ (front inclination of the drill) should vary from a minimum of $0^{\circ}$ to a maximum of $45^{\circ}$.
3. During the execution of a seat with double diameter (as in the diagram above), the depth of the Ø A must be at least 5mm longer than the dimension «L2» of the bubbles.

| DIMENSION ØA <br> OF THE <br> ITEM TO APPLY | ØT1 | L2 |
| :---: | :---: | :---: |
| 5 | 10,5 | 1 |
| $6 / 6,5$ | 10,5 | 1 |
| $8 / 8,5$ | 13 | 18 |
| $10 / 10,5$ | 16,5 | 22,5 |
| 11 | 16,5 | 1 |
| 11,5 | 16,5 | 1 |
| $12 / 12,5$ | 16,5 | 24 |
| $14 / 14,5$ | 17,5 | 24,5 |
| 15 | 20 | 1 |
| 16 | 20,5 | 1 |
| 18 | 22,5 | 29,5 |
| 19 | 23,5 | 33,5 |
| 20 | 24,5 | 1 |
| 25 | 29 | 35 |
| 30 | 3 |  |

In order to obtain a proper circulation of the coolant, position the reference mark $\mathbf{S}$ that you can find on the bubble as indicated in the diagram.

## POSITIONING OF THE BAFFLES

In order to obtain a proper circulation of the liquid, position the reference marks $\mathbf{S}$ that you can find on the baffle as indicated in the diagram.

The fiducial marks correspond to the position of the blade.

## APPLICATION OF BAFFLES RL / RLS

Considering that the baffles with $\varnothing$ bigger than 14 mm are available only in the set $F$, and if it is not possible to machine the hole with gun drill, it is advisable to apply the baffle set $F$ with a width $B$ lower than the major diameter and to proceede as in the example.

EXEMPLE OF APPLICATION RL-16Fp ( $B=15,5 \mathrm{~mm}$ )

1. perform hole with drill $\varnothing 15,5$;
2. perform blade with a reamer $\varnothing 16$ for a depth of L2+5mm;
3. to go on with the procedure for the application of the item set F .

## EXECUTION PLUGS' HOUSING

1. PERFORM HOLE WITH DRILL (the diameter of the drill has to correspond to the mark of the plug; exemple: for the plug TR-8 use drill Ø8). See picture 1.
The diameter obtained by the drill can also be increased of $0,2 \div 0,3$ millimeters.
2. PERFORM BLADE WITH A SUITABLE REAMER. See picture 2 . In the operation $n^{\circ} 2$ the hole has to be calibrated with a suitable reamer to $\varnothing$ drill $+0,5$ (exemple: the hole $\varnothing 8$ will be brought up to $\varnothing 8,5$ ). N.B.: the cutting speed of this operation will change according to the type of machined steel and will be equal to the one used for any other reamer in HSS (high-speed tool steel).
3. PERFORM RETAINING GROOVE WITH SUITABLE TOOL. See picture 3

## SOME ADVICE FOR THE CORRECT USE OF ABOVE MENTIONED TOOL

A. Before beginning the operation put a drop of oil on the chamfer created on the piece by the reamer (picture 2 ) to encourage the sliding of the centering bush of the tool.
B. The descent in vertical of the tool has to be slow (as adopted when a center drill is used). Consider however that such a tool works only in the last millimiter of the descent.
C. When the two elements of the tool separeted by the spring (visible) touch each other, the operation is completed. Now neither maiking further pressure on the tool nor stopping in such a position more than a few seconds is not advisable (so to avoid the heating of the centering bush that rubs on the piece).
D. The above mentioned advice, related to the pressure that has to be applied on the tool, are obviously usable by the worker only in case of operation on a drill or also on a miller, only if provided by a mobile chuck (type drill) so to have the sensitivity of th practiced pressure. In case of performing the above mentioned operation on a machine with fixed head or on a machining center, it's necessary to use the tool with the pressure compensator (provided on request).

## PLUGS ASSEMBLY

1. Insert the piece to be assembled in its seat.
2. Insert the keys as in picture 4.
3. Holding the key "A" tight, rotate the key "B" clockwise blocking the plug with strongpressure, but using only the hands (without the help of any other keys to subsequently increase the pressure of locking).

## PLUGS DISASSEMBLY

1. Insert the keys as in picture 4.
2. Unblock the plug holding the key " $A$ " tight and rotating the key " $B$ " counter clockwise (1-2 turns maximum).
3. Remove the keys.
4. Using the key "B" from the side with the inner thread hook the plug and extract.

| IN-25FD | 19*23 | $240 \div 290$ |

## MATERIALS HARDNESS

The standard cutters code $\mathrm{IN}-.$. are made in HSS and titanium carbonitride coated. Such cutters can machine steel with maximum hardness of $40 \div 42 \mathrm{HRC}$; it is necessary to consider that as the hardness of the steel increases the working life of the cutter becomes significantly shorter. In order to meet the growing need to assembly cooling components on pre hardened inserts, a new set of cutters made in carbide steel code IN-..D able to machine steel with hardness up to $50 \div 52 \mathrm{HRC}$, is now available.

| TOOL | $\mathbf{S}$ |
| :---: | :---: |
| UT-0 | 4,3 |
| UT-1 | 4,3 |
| UT-2 | 4,3 |
| UT-3 | 4,7 |
| UT-4 | 5,1 |

## ADVICES FOR THE CORRECT USE OF THE TOOL "UT"

1. The tool "UT" is designed to be used on machines where the forward movement is manually controlled.
2. The cutter starts the machining of the groove a few millimiters after the centering bush " BC " get in contact with the chamfer on the hole. Starting from this point the forward movement has to be slow.
3. The machining of the groove is completed when the gap " S " is completely closed by the forward movement of the tool.
4. Once the forward movement is completed neither making further pressure on the tool, nor stopping in such a position more than a few seconds is advisable.

## ADVICES FOR THE CORRECT USE OF THE TOOL "UT-C"

1. The tool "UT-C" is designed to be used on CNC machines where forward movement is electronically controlled.
2. It is possible to move in fast forward till 2 mm from the working position (contact point between centering bush "BC" and chamfer of the hole).
3. Starting from this point a feed rate of $0,05 \mathrm{~mm} /$ rotation is suggested.
4. The machining of the groove is completed when the gap " S " is completely closed by the forward movement of the tool. To guarantee the proper machining we suggest to set an extra stroke of $2 \div 3 \mathrm{~mm}$, the extra stroke will be compensated by a spring inside the tool.
5. Once the forward movement is completed neither making further pressure on the tool, nor stopping in such a position more than a few seconds is advisable.
